

Wireless Security

Assesses the security posture of an organization's wireless network. A Wireless Vulnerability Assessment provides an organization validation of current security controls protecting the wireless network, and provides a point in time assessment of the risks posed by the wireless network. A Wireless Vulnerability Assessment will help an organization identify potential risks due to unauthorized access to the wireless network, unauthorized monitoring of wireless communications and other wireless vulnerabilities. Recommendations for improving the security of the wireless network will be identified in the final deliverables. All components of the wireless system are examined including: wireless access points, client configuration, and supporting infrastructure such as authentication servers, and access control devices.
